***Warfighter Support Sep 13 2022 An assessment of the ground combat uniforms and camouflage utility uniforms currently in use in the DoD. Although the Army, Air Force, and Marine Corps state that they have estab. require. for combat clothing that include performance capabilities, the report found that performance standards are not related to specific combat environ. The report found technical production standards guide the manufacturing of uniforms for all four services. Service and Special Ops Command officials indicate that the ground combat uniforms and their protective gear and body armor are interoperable. However, service officials stated that they do not have a requirement to regularly test their uniform and other services' protective gear for interoperability. Charts and tables.***

***Measuring Health May 09 2022 Worldwide economic constraints on health care systems have highlighted the importance of evidence-based medicine and evidence-based health policy. The resulting clinical trials and health services research studies require instruments to monitor the outcomes of care and the output of the health system. However, the over-abundance of competing measurement scales can make choosing a measure difficult at best. Measuring Health provides in-depth reviews of over 100 of the leading health measurement tools and serves as a guide for choosing among them. Now in its third edition, this book provides a critical overview of the field of health measurement, with a technical introduction and discussion of the history and future directions for the field. This latest edition updates the information on each of the measures previously reviewed, and includes a complete new chapter on anxiety measurement to accompany the one on depression. It has also added new instruments to those previously reviewed in each***

*of the chapters in the book. Chapters cover measurements of physical disability, social health, psychological well-being, anxiety, depression, mental status testing, pain, general health status and quality of life. Each chapter presents a tabular comparison of the quality of the instruments reviewed, followed by a detailed description of each method, covering its purpose and conceptual basis, its reliability and validity and, where possible, shows a copy of the actual scale. To ensure accuracy of the information, each review has been approved by the original author of each instrument or by an acknowledged expert.*

We appreciate your support of the preservation process, and thank you for being an important part of keeping this knowledge alive and relevant.*

*Measuring the Quality of Health Care Aug 20 2020 The National Roundtable on Health Care Quality was established in 1995 by the Institute of Medicine. The Roundtable consists of experts formally appointed through procedures of the National Research Council (NRC) who represent both public and private-sector perspectives and appropriate areas of substantive expertise (not organizations). From the public sector, heads of appropriate Federal agencies serve. It offers a unique, nonadversarial environment to explore ongoing rapid changes in the medical marketplace and the implications of these changes for the quality of health and health care in this nation. The Roundtable has a liaison panel focused on quality of care in managed care organizations. The Roundtable convenes nationally prominent representatives of the private and public sector (regional, state and federal), academia, patients, and the health media to analyze unfolding issues concerning quality, to hold workshops and commission papers on significant topics, and when appropriate, to produce periodic statements for the nation on quality of care matters. By providing a structured opportunity for regular communication and interaction, the Roundtable fosters candid discussion among*

*Automated Size Prediction for Try-on of U.S. Army Men's Initial Issue Dress Uniform Jun 22 2023* *The current manual system for selecting uniform sizes for try on is inefficient due to errors in measurement of soldiers and repeated trials of various sizes of garments. Inaccuracies in measurement generally result from the improper placement of the measuring tape and from variations in its tension. This is exacerbated by the use of soldiers on detail assigned the task of measuring. Even among experienced fitters, measurements are inconsistent-measurements taken by the same fitter may vary in consistency when the fitter gets tired. Although size prediction charts are available, they are not effectively used because of the fitters' lack of confidence in the accuracy of the measurements and the difficulties of accounting for priorities among body dimensions. Instead of relying on the prediction charts, a 'you look like this size' approach is generally employed.*

*Development of a Safety Service Patrol Uniform Standard May 21 2023 The Virginia Department of Transportation's (VDOT) Safety Service Patrollers (SSP) use different color uniforms depending on their geographic location. Red jumpsuits are used in the Northern Virginia District, orange jumpsuits are used in the Fredericksburg District and by the Tidewater Tunnel Patrollers, and white shirts and blue pants with a flagger's vest are used in the Suffok District. The purpose of this research was to identify and evaluate various colors and configurations of retroreflective materials for use on the SSP uniform in an effort to maximize employee safety. This study was to recommend a color, or colors; a pattern of retroreflective material; and the type of uniform that should be used as VDOT's standard SSP uniform. The scope of the project was limited to the use of existing materials and colors readily available from vendors. The uniforms selected for testing were evaluated under controlled conditions in the field. This evaluation consisted of photographing the existing SSP uniforms and the two prototypes on a closed portion of roadway with little to no external lighting. Photographs were taken of each uniform under daytime and nighttime conditions. A videotape was used to capture how the uniforms appear while a driver drives toward them during nighttime conditions under low and high beams. The videotape was also used to capture the ergonomic movements of the uniforms and how well the retroreflective tape depicted the actual movements as humans. In addition to photographing and videotaping the uniforms, the researcher made photometric measurements under daytime and nighttime conditions and laboratory colorimetric measurements of each type uniform. The report concludes that fluorescent colors enhance the daytime conspicuity of highway worker's clothing. The literature indicates that fluorescent orange and fluorescent strong yellow-green are the two best colors for use on high-visibility clothing. Of the garments studied in the daytime portion of this research, the fluorescent strong yellow-green garment was determined to be the most visible. The addition of circumferential retroreflective bands on the limbs and major hinge points (knees and elbows) provides for enhanced recognition as a person during nighttime viewing.*

*Automated Size Prediction for Try-on U.S. Army Men's Initial Dress Uniform. Final Report Addendum Aug 24 2023* The following data were collected at Fort Jackson, SC during the month of July 1992. The Chief of the CIIP, Mr. Lonnie Turner, guaranteed that all measuring that month would be done by trained CIIP employees, not by soldiers on detail. This was an attempt at getting the most accurate measurements possible. A disclaimer is in order, however, since the standard practice at the CIIP is to round up torso circumference measurements to the next integer. For example, a person measuring 42.25 in the chest was recorded as measuring 43. This imprecision caused the project team to have little confidence in the accuracy of the data. The data were important, however, in that the case-based-reasoning software had to have cases in order to build decision parameters. These were the data used to seed the Remind software tool. Their purpose was to test the usefulness of a case-based-reasoning tool for the task of size prediction in military uniforms (a stable product). The project team hoped to reseed the tool with scan data before the close of the project, but the scanner was not ready. In order for the size prediction tool to be useful, equivalent cases using scan data should be used to seed Remind%. Using the knowledge gained in the learning curve studies (for determining the necessary number of cases needed for useful prediction), a rule-based size prediction scheme, which runs faster than case-based, could then be developed.
