**Autoimmunity and the Pathogenesis of Diabetes** Mar 30 2021 It has been a challenge for us to edit this volume of Endocrinology and Metabolism: Progress in Research and Clinical Practice. The topic of the pathogenesis of insulin-dependent, type I diabetes mellitus is particularly appropriate for this series, since advances in this area have been made, to a large extent, by applying state-of-the-art laboratory techniques to clinical samples. Over the last several years, a number of lines of evidence have been gathered, suggesting that classic type I diabetes mellitus results from the autoimmune destruction of pancreatic beta-cells in genetically susceptible individuals. This hypothesis is particularly appealing because it offers a rational approach to the prevention of diabetes by immunosuppression. We have tried to present a balanced, authoritative summary of the information currently available to support the autoimmune hypothesis for the pathogenesis of human type I diabetes, to place this information in historical perspective, to include relevant information from animal models of type I diabetes in which more invasive experimentation is ethical, and, finally, to update the reader on the current status of attempts to intervene in the progression of diabetes with immunosuppressive drugs. **Diabetes Mellitus in Developing Countries and Underserved Communities** Jun 20 2020 Adopting a truly global perspective and a practical approach to diabetes—including pathophysiology, genetics, regional peculiarities, management, prevention and best practices—this book is an excellent resource for clinicians and policy-makers working with patients in more austere settings. The global prevalence of diabetes is estimated to increase from 422 million in 2014 to 592 million in 2035. Sadly, low- and middle-economy countries are projected to experience the steepest increase, but even in developed economies, vulnerable demographic subgroups manifest disparities in diabetes prevalence, quality of care, and outcomes. This book extends coverage to those underserved and minority communities in the developed world. In a consistent chapter format, it discusses classification, pathophysiology, genomics, diagnosis, prevention and management of diabetes in economically challenged regions as well as underserved populations in affluent nations. Suggestions regarding future directions in the organization of diabetes care delivery, prevention and research priorities are also provided. The detailed identification of barriers to optimal care and the practical approach to the management and prevention of diabetes make *Diabetes Mellitus in Developing Countries and Underserved Communities* a valuable resource for clinicians, researchers and health policy leaders.

**Controversies in Diabetes and Pregnancy** Feb 09 2022 As I read this unique volume on diabetes and pregnancy edited by Lois Jovanovic, I was struck by two themes that run throughout these collected chapters. First, this volume provides an excellent assessment of past problems, present management, and future challenges presented by diabetes in pregnancy. Orury's unique, longitudinal experience with diabetes in pregnancy provides the reader with an important overview, as does Coetzee's discussion of gestational diabetes. Current problems-determining the etiology and prevention of congenital malformations in infants of diabetic mothers (10M), assessment of antepartum fetal condition, management of pregnant patients with diabetic retinopathy, recognition of thyroid dysfunction in the pregnant diabetic woman, and understanding the multitude of metabolic sequelae observed in the 10M—are thoroughly reviewed. Finally, important considerations for future treatment and therapy such as the adaptation of the fetal pancreas to the disordered intra uterine environment often seen in maternal diabetes, the use of fetal pancreatic tissue for transplantation, the application of exercise in the management of the pregnant woman with diabetes, and the long-term consequences for the 10M provide an exciting glimpse into the future. The second important theme that emerges is the critical role the problem of diabetes in pregnancy has played in our understanding of maternal and fetal physiology. Clinical observations supported by basic research have emphasized the role of fetal fuels in teratogenesis.
