Should you provide interactive features and social features? Planning documents: Should you put all information into one document, or should you supply several user manuals for specific purposes and user groups? How should you name your documents? Planning document sections: What are the major sections that your documents should consist of? Are there any standard sections that you shouldn't forget? Planning topics: What types of information do your clients need? How should you build and name the individual topics within the document? Planning the order of sections and topics: How should you organize the sections and topics within your documents? What comes first? Planning navigation: Which navigational devices should you provide in printed documents and in online help systems? Where should you provide links or cross-references and where not? The book describes the history, value, and controversies of manuals. In addition, it explores issues and experiences in the creation of manuals, identifies research issues related to the use and evaluation of manuals, and addresses training as a context for the application of treatment manuals. Key areas of coverage include: Reports of experiences with major, internationally established manuals, formulations of innovative practices by their developers, and specifications of training programs. Discussion of the various formats of manuals, demonstrating their benefit and transportability across different contexts. Surveys of a broad selection of manuals, creating a flexible and diversified concept of what forms manuals may take. Essential guidance for using manuals, which is an indispensable step for the field to progress and to claim to health resource commissioning, governments and insurance agencies that the systemic practice is evidence based and effective. The task of language engineering is to develop the technology for building computer systems which can perform useful linguistic tasks such as machine assisted translation, text retrieval, message classification and document summarisation. Such systems often require the use of a parser which can extract specific types of grammatical data from pre-defined classes of input text. There are many parsers already available for use in language engineering systems. However, many different linguistic formalisms and parsing algorithms are employed. Grammatical coverage varies, as does the nature of the syntactic information extracted. Direct comparison between systems is difficult because each is likely to have been evaluated using different test criteria. In this volume, eight different parsers are applied to the same task, that of analysing a set of sentences derived from software instruction manuals. Each parser is presented in a separate chapter. Evaluation of performance is carried out using a standard set of criteria with the results being presented in a set of tables which have the same format for each system. Three additional chapters provide further analysis of the results as well as discussing possible approaches to the standardisation of parse tree data. Five parse trees are provided for each system in an appendix, allowing further direct comparison between systems by the reader. The book will be of interest to students, researchers and practitioners in the areas of computational linguistics, computer science, information retrieval, language engineering, linguistics and machine assisted translation. Every day we interact with thousands of consumer products. We not only expect them to perform their functions safely, reliably, and efficiently, but also to do it so seamlessly that we don't even think about it. However, with the many factors involved in consumer product design, from the application of human factors and ergonomics principles to reducing risks of malfunction and the total life cycle cost, well, the process just seems to get more complex. Edited by well-known and well-respected experts, the two-volumes of Handbook of Human Factors and Ergonomics in Consumer Product Design simplify this process. The first volume, Human Factors and Ergonomics in Consumer Product Design: Methods and Techniques, outlines the how to incorporate Human Factors and Ergonomics (HF/E) principles and knowledge into the design of consumer products in a variety of applications. It discusses the user-centered design process, starting with how mental workload affects every day interactions with consumer products and what lessons may be applied to product design. The book then highlights the ever-increasing role of information technology, including digital imaging, video and other media, and virtual reality applications in consumer product design. It also explores user-centered aspect of consumer product development with discussions of user-centered vs. task-based approach, articulation and assessment of user requirements and needs, interaction with design models, and eco design. With contributions from a team of researchers from 21 countries, the book covers the current state of the art methods and techniques of product ergonomics. It provides an increased knowledge of how to apply the HF/E principles that ultimately leads to better product design.
